Data Management and Sharing Plan

Content for the Research.gov webform, which has replaced the PDF upload.

This project is theoretical research in pure mathematics. It involves no human subjects, sensitive data, or physical samples or collections, and it requires no computation. Its research products are research articles and expository materials from the Broader Impacts activities. All of them will be shared openly, free of charge and without restriction.

Category 1: Research articles and preprints

Description. Research papers presenting the results of the project (theorems, proofs, and examples), and an expository survey if one is written.

Access policies and limitations. Not applicable: there are no restrictions on access.

Data standards and metadata. PDF, with LaTeX source deposited on arXiv; arXiv metadata (title, authors, abstract, and Mathematics Subject Classification codes); DOIs for published versions.

Provenance. New (user-defined): original research by the PI.

Public archiving. arXiv for preprints, and the NSF Public Access Repository (NSF-PAR) for the accepted manuscript or published version of each journal article. The LaTeX sources will also be posted in a public GitHub repository.

Timeline for public accessibility. At time of publication. Each preprint will be posted to arXiv no later than its submission to a journal, and each accepted manuscript will be deposited in NSF-PAR when it is published, in accordance with NSF's public access policy.

Data availability. Indefinitely. arXiv is a permanent archive, and NSF-PAR provides long-term public access; the PI will follow both repositories' retention policies.

Accountability. Edward Varvak (PI).

Category 2: Seminar and workshop materials

Description. Notes and recorded talks from the learning seminar on Lagrangian fibrations and Hitchin systems, and lecture materials from the early-career workshop, both described in the Broader Impacts section of the Project Description.

Access policies and limitations. Not applicable. Talks will be recorded and posted only with the speaker's consent.

Data standards and metadata. PDF (notes typeset in LaTeX) and MP4 video, each labeled with title, speaker, and date.

Provenance. New (user-defined): materials created by the PI and seminar speakers.

Public archiving. Zenodo, with links from the seminar's web page.

Timeline for public accessibility. User-defined: within one month of each seminar meeting or workshop.

Data availability. At least 10 years, following Zenodo's retention policy.

Accountability. Edward Varvak (PI).
